Problem-Solution Fit Canvas 2.0

Health360: Comprehensive Healthcare Risk & Disease Analysis | Purpose / Vision

1. CUSTOMER SEGMENT(S)

Primary users: healthcare providers, clinical risk assessment officers, healthcare data analysts and public-health researchers.

Population analyzed: 5,000 patient records across 17 columns, covering demographics, lifestyle and clinical indicators.

CS · WHO IS THE CUSTOMER?

6. CUSTOMER CONSTRAINTS

- Manual review of patient records is time-consuming.
- Risk patterns can be difficult to spot across age groups and BMI categories.
- Clinical and lifestyle variables need to be compared together.
- Dataset analysis is exploratory, not individual diagnosis.

CC · BARRIERS TO ACTION

5. AVAILABLE SOLUTIONS

- Tableau dashboard with nine listed visualizations.
- KPI overview of patient health and disease indicators.
- Bar, grouped-bar, pie, donut and heat-map views.
- Interactive age-group and lifestyle comparisons.
- Tableau story to communicate findings.

AS · EXISTING / AVAILABLE OPTIONS

2. JOBS-TO-BE-DONE / PROBLEMS

- Identify patient segments that may need closer review.
- Compare average blood pressure across six age groups.
- Explore heart-disease and diabetes prevalence by BMI category.
- Compare smoking, alcohol, exercise and fatigue patterns.
- Communicate findings for preventive-care planning.

JBP · WHAT USERS NEED TO ACHIEVE

9. PROBLEM ROOT CAUSE

Healthcare data combines age, BMI, blood pressure, cholesterol, glucose, smoking, alcohol, exercise and symptoms. When reviewed separately or manually, cross-group patterns are harder to notice. Visual comparisons can reveal associations, but do not prove causation.

RC · WHY THE PROBLEM EXISTS

7. BEHAVIOUR

Users explore the dashboard, compare age groups and BMI categories, review chart labels and filters, then use the Tableau story to communicate patterns. The project supports evidence-informed review; clinical decisions remain with qualified professionals.

BE · HOW USERS ADDRESS THE PROBLEM

3. TRIGGERS

- Need to review chronic-disease risk patterns.
- Questions about differences between age groups.
- Need to compare lifestyle indicators with recorded outcomes.
- Public-health or preventive-care analysis task.

TR · WHAT PROMPTS ACTION

10. YOUR SOLUTION

Health360 Tableau analytics website
A website presenting 5,000 healthcare records and 17 columns, with nine chart types: KPI overview; average blood pressure by age; alcohol/smoking by age; exercise donut; age-distribution pie; heart disease vs diabetes by BMI; BMI vs heart-disease rate; BMI/exercise heat map; and fatigue by age group.

Includes embedded Tableau dashboard and story.

SL · PROPOSED SOLUTION

8. CHANNELS OF BEHAVIOUR

Online: Health360 website, embedded Tableau dashboard and Tableau story; interactive chart exploration when Tableau embedding is available.

Offline: presentation or review meeting using exported dashboard screenshots and summarized findings.

CH · HOW USERS ACCESS THE SOLUTION

4. EMOTIONS: BEFORE / AFTER

Before: uncertainty when manually comparing many indicators and difficulty spotting group-level patterns.

After: clearer visual summaries, easier comparisons and a structured basis for discussion—without treating patterns as a diagnosis.

EM · USER EXPERIENCE

Data note: The project brief specifies 5,000 records and 17 columns. Tableau screenshots show average blood pressure by age group and charts for lifestyle patterns and patient distribution. These are exploratory observations, not causal proof or validated clinical predictions.
