PROJECT REPORT

Health360

Comprehensive Healthcare Risk and Disease Analytics

A student project presenting sample healthcare indicators through interactive dashboards, age-group comparisons, lifestyle-risk views, and a Tableau story.

Project Name	Health360: Clinical and Healthcare Risk Analysis
Date	19 October 2026
Team ID	
Website	Open Health360 website

Prepared using the supplied project report template and project links.

REPORT CONTENTS

Section	Heading	Coverage
1	Introduction	Overview and purpose
2	Ideation Phase	Problem statement, empathy map, brainstorming
3	Requirement Analysis	Journey map, requirements, data flow, technology
4	Project Design	Solution fit, proposed solution, architecture
5	Project Planning & Scheduling	Project phases
6	Functional and Performance Testing	Test cases and performance considerations
7	Results	Published outputs
8	Advantages & Disadvantages	Benefits and limitations
9	Conclusion	Project summary
10	Future Scope	Possible enhancements
11	Appendix	Clickable links, source code and dataset notes

Important: The dashboard’s 5,000 patient representation is illustrative sample data, not a verified count of real patients. The project is not a diagnostic tool or a substitute for professional medical advice.

1. INTRODUCTION

1.1 Project Overview

Health360: Comprehensive Healthcare Risk and Disease Analytics is a student project designed to make sample healthcare indicators easier to explore visually. The website connects viewers to a Tableau dashboard and a companion story. Users can compare indicators by age group and lifestyle factor, review summary cards, and inspect visual patterns.

1.2 Purpose

• Present sample health indicators in a clear, interactive dashboard.

• Summarize patient representation, average blood pressure, lifestyle indicators, and age segments.

• Explore patterns involving alcohol, smoking, fatigue, and exercise.

• Make project outputs easy to share through the website, Tableau links, repository, and demo video.

2. IDEATION PHASE

2.1 Problem Statement

Healthcare indicators can be difficult to compare when scattered across separate values or tables. Health360 addresses this presentation problem by grouping sample measures into KPI cards, age-group charts, filters, and a lifestyle-risk heatmap, with a story view for guided exploration.

2.2 Empathy Map Canvas

Perspective	Project interpretation
Says	I want to understand the dashboard quickly and compare groups easily.
Thinks	Which indicators and age groups show different values?
Does	Uses filters, reads summary cards, reviews charts, and opens the story view.
Feels	Wants information to be understandable, consistent, and easy to navigate.

2.3 Brainstorming

• Use KPI cards for at-a-glance summaries.

• Add age-group and indicator filters.

• Use a bar chart for average systolic blood pressure across age groups.

• Use a lifestyle-risk heatmap to compare relative patterns.

• Provide reset and print controls plus Tableau links.

3. REQUIREMENT ANALYSIS

3.1 Customer Journey Map

Stage	User action	Expected experience
Discover	Open the Health360 website	Understand purpose and available views
Explore	Choose age group or indicator	Focus on selected options
Interpret	Review KPI cards, chart, heatmap, and story	Compare illustrative values and patterns
Share	Open links or print dashboard	Present the project to reviewers

3.2 Solution Requirement

• Responsive web page for desktop and mobile-sized screens.

• KPI cards, charts, filters, and lifestyle heatmap.

• Age-group and indicator selection, reset filters, and print dashboard.

• Published Tableau dashboard/story and public project links.

3.3 Data Flow Diagram

Conceptual high-level flow:

Sample healthcare data	→	Grouping and indicator summaries	→	Dashboard / story visuals
Age and lifestyle fields	→	Filters and chart measures	→	User exploration

This is a conceptual flow based on the described interface; it does not claim an undocumented backend pipeline.

3.4 Technology Stack

Technology	Role
HTML	Structure and content of the web page
CSS	Responsive layout, visual styling, and print styling
JavaScript	Interactive controls and chart/filter behavior
Tableau Public	Published healthcare-risk dashboard and patient-risk/lifestyle story
GitHub Pages	Hosting the public project website

4. PROJECT DESIGN

4.1 Problem-Solution Fit

The dashboard addresses the need to view sample health indicators together. KPI cards support quick scanning, charts support age-group comparison, filters allow focused exploration, and the Tableau story provides a guided view.

4.2 Proposed Solution

• A Health360 web page that introduces the analytics project.

• Summary cards for patient representation, average blood pressure, lifestyle indicators, and age segments.

• Average blood pressure bar chart and lifestyle-risk heatmap.

• Filters, reset action, and print-dashboard control.

• Links to Tableau dashboard, story, GitHub repository, and demo video.

4.3 Solution Architecture

Presentation layer	Analytics layer	Publishing layer
Responsive HTML/CSS/JavaScript website	KPI summaries, age-group chart, heatmap, Tableau views	GitHub repository, GitHub Pages, Tableau Public, Google Drive demo

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

Phase	Work item	Deliverable / evidence
Define	Identify project problem and indicators	Project scope
Design	Plan cards, charts, filters, and layout	Dashboard structure
Build	Create web page and interactive controls	Website source files
Visualize	Prepare Tableau dashboard and story	Published Tableau views
Publish	Publish website through GitHub Pages	Public website and repository
Review	Check links, filters, charts, and print view	Demo-ready project

This is a high-level plan. Individual assignments and completion dates were not supplied and are not invented.

6. FUNCTIONAL AND PERFORMANCE TESTING

6.1 Performance Testing

Test area	Check	Expected result
Website loading	Open published page in a browser	Page content and styling appear
Responsive layout	Check desktop and narrow width	Content remains readable
Filters	Change age group / indicator	View responds to selection
Reset filters	Activate reset control	Default selections return
Print dashboard	Use print control	Print-friendly view opens
External links	Open each published resource	Correct resource opens

No measured load-time or stress-test results were provided. These are test cases and expected outcomes, not claimed benchmark results.

7. RESULTS

7.1 Output Screenshots and Published Outputs

The described dashboard includes a 5,000 sample patient representation, average blood-pressure summary, lifestyle indicator count, age-segment count, age-group blood-pressure chart, and lifestyle-risk heatmap. Open the live published outputs below to view the current display.

- Health360 Web Page
- Tableau Dashboard — Health360 Healthcare Risk Analysis
- Tableau Story — Patient Risk Lifestyle Insights

Separate screenshot files were not supplied, so this report links to the live outputs rather than embedding screenshots.

8. ADVANTAGES & DISADVANTAGES

Advantages

- Visual summaries make sample indicators easier to scan and compare.
- Filters support focused exploration by age group and indicator.
- Online links make the project easy to share and demonstrate.
- Print control supports presentation and documentation.

Limitations

- Values are illustrative and not validated clinical evidence.
- The project is not a diagnostic system and does not replace medical advice.
- Published Tableau resources require internet access.
- No live hospital-record integration is claimed.

9. CONCLUSION

Health360 demonstrates how a website and interactive analytics views can bring sample healthcare indicators together for educational exploration. KPI cards, age-group comparisons, lifestyle views, and a guided story offer multiple ways to review the project theme. The website, Tableau resources, repository, and demo video provide access points for review. The project should be treated as an analytics presentation prototype, not a medical diagnosis or treatment tool.

10. FUTURE SCOPE

- Use a documented, ethically sourced, de-identified dataset with clear provenance.
- Add more validated indicators and richer age/lifestyle comparisons.
- Improve accessibility through keyboard navigation and clear chart descriptions.
- Add automated checks for broken links and dashboard behavior.
- Conduct formal usability and performance tests across browsers and devices.
- Require privacy safeguards and clinical validation before real-world healthcare use.

11. APPENDIX

11.1 Project Links

The links below are clickable in this PDF. Select “Open resource” to visit each live resource.

Resource	Link	Description
Health360 Website	Open resource	Published project website
Tableau Dashboard	Open resource	Health360 Healthcare Risk Analysis
Tableau Story	Open resource	Patient Risk Lifestyle Insights
GitHub Repository	Open resource	Project files and repository
Demo Video	Open resource	Google Drive project demonstration

11.2 Source Code

The source code is available through the GitHub repository above. The project is described as using HTML, CSS, and JavaScript; exact implementation details should be checked in the repository files.

11.3 Dataset Link

A separate public dataset URL was not provided, so no dataset link has been invented. Dashboard values are described as illustrative sample data.

11.4 Demo Video

The supplied Google Drive demo video is linked above. Access may depend on the file’s sharing permissions.
